LuCaNT Conference Series Mission
The [LuCaNT] conference series aims to provide a venue to highlight the value and importance of mathematical databases in the modern mathematical research landscape and to increase human understanding of related mathematics.

LuCaNT 2027 Submission and Review Process Expectations and Norms

The organizers of LuCaNT 2027 recognize that AI use is now a reality of our profession. We also recognize the wide spectrum of views on AI usage among our community members. Guided by the principles set forth in the Leiden Declaration and a desire to emphasize the expansion of human knowledge as a central goal in our field, we have developed the following policies for papers submitted for consideration in LuCaNT 2027. We also took inspiration from the Simons Institute AI and Theoretical Computer Science Working Group Report.

Expectations of authors

- Only humans may be listed as authors of papers, and they must be listed by name.
- As with prior LuCaNT proceedings, we aim to prioritize the verifiability and reproducibility of the code produced. Any code associated with the paper must be made available for testing and verification, and use of computer algebra systems should be clearly described in the paper.
- Each paper (and affiliated code) must have a statement about AI usage, even if no AI was used at all. Authors who choose to use AI in any capacity beyond basic copy-editing or embedded in search engines must include an "AI Methodology" section. Samples of what to include in such sections may be found in Appendix A of the Simons Institute AITCS Working Group Report and a template for authors who would like more guidance is available as a downloadable LaTeX file on the Simons Institute webpage.
- Any one author can be listed on no more than 3 submitted papers.
- At the time of submission, each author must certify on EditFlow that they, "understand and have verified the work they are submitting, and accept responsibility for the correctness and presentation of the work."
- Submissions must be posted to arXiv prior to submission.

Expectations of reviewers

- Direct reports from AI agents may not be submitted as reviews. Reviewers of papers may use AI agents to support their review, but we expect reviewers to have

read the article themselves and to write their final report based on their own impressions of the paper.
- Reviewers may not use commercial models if the author(s) have opted for this restriction (see the Review Process section for more information).
- Reviewers must provide an AI Usage Statement, which will be made available to authors, detailing if and how AI was used to help evaluate the paper.
- Any AI use by reviewers must be done with all optional settings regarding sharing of training data turned off.
- Reviewers shall not penalize authors for the use of AI or the choice not to use AI, but shall judge the work on the merits of the mathematical or computational work and the clarity with which that work is presented.
- Reviewers who have concerns about the veracity of the AI statement or methodology in a paper should report their concerns immediately to a member of the editorial board. The same applies to concerns of plagiarism.

Expectations for the editorial board

- The editorial board will strive to be as transparent as possible about all AI policies.
- The editorial board will discuss all papers and make all decisions about which papers to accept. All papers will be judged on the merits of the mathematical work and the clarity with which that work is presented regardless of whether AI was used by the authors.

Review Process

- AI will be used by the editorial board during two stages of the review process.
    a. Each paper will be initially run through an AI agent to check for major potential errors before being sent to external reviewers. If major potential error(s) are claimed by AI, those errors will be carefully verified by the editors first and, if the error(s) are verified, the author(s) of the paper will be informed of the issue.
    b. Code affiliated with the paper will be reviewed with an AI agent to produce a report, based on the MaRDI process used in past iterations of the conference, which addresses issues of findability and reproducibility of the code, and verifiability of the data.
- In each case, the editorial board will only use AI systems with all optional settings regarding sharing of training data turned off.
- Authors whose work did not make use of commercial models may request, via an email to editors@lucant.org, that any AI agent involved in the review process of their paper be from Open Math Model (https://www.openmathmodel.org/).

- The prompts used in (a) and (b) above will be available to authors two weeks before the submission deadline.

The editorial board reserves the right to modify policies if needed as AI usage evolves.

AI Usage Statement for this policy: The organizers of LuCaNT 2027 are the sole authors of the LuCaNT 2027 AI Policy. No AI was used in the development or writing of this policy.
